

## **Interview/Questionnaire:**

### **After Both Tasks:**

#### **Ease of use**

In your opinion which of the two methods did you find easier to use and why?

How confident would you be that in a week you would be able to come back and create another questionnaire to a given brief without going over the training material again using the textual editor?

Is your answer dependant on whether you have the questionnaires created today to refer to?

As above but with the web editor?

What do you think would have been the minimum amount of training you would have had to receive to complete the task using code:

- None
- Example questionnaire file
- Example files + documentation as today

As above except for web editor.

#### **Efficiency**

Which of the two methods do you feel was the more efficient/quicker for the tasks you have just sat and why?

How would you improve the other method to make it more efficient/quicker for the task you just sat?

If you were asked to produce questionnaires frequently do you think one method would be much more efficient/quicker in the long run/with more experience?

If you answered yes to the above, how would you improve the other method to make it more efficient/quicker for frequent tasks?

#### **Clarity**

How confident are you that the two questionnaires you wrote with text editor were correct and will match the brief?

How confident are you that the two questionnaires you wrote with the web editor were correct and will match the brief?

#### **General:**

If I asked you to conduct this task again which would you prefer to use?

If I asked you to conduct similar tasks every day for the next year, which would you prefer to use?
